

## FEATURES

- 13-bit temperature-to-digital converter
- 40°C to +150°C operating temperature range
- ±0.5°C typical accuracy
- 0.03125°C temperature resolution
- Shutdown current of 1 µA
- Power dissipation of 0.631 mW at V<sub>DD</sub> = 3.3 V
- SPI- and DSP-compatible serial interface
- Shutdown mode
- Space-saving SOT-23 and MSOP packages
- Compatible with AD7814

## APPLICATIONS

- Medical equipment
- Automotive
  - Environmental controls
  - Oil temperature
  - Hydraulic systems
- Cellular phones
- Hard disk drives
- Personal computers
- Electronic test equipment
- Office equipment
- Domestic appliances
- Process control

## GENERAL DESCRIPTION

The ADT7301 is a complete temperature monitoring system available in SOT-23 and MSOP packages. It contains a band gap temperature sensor and a 13-bit ADC to monitor and digitize the temperature reading to a resolution of 0.03125°C.

The ADT7301 has a flexible serial interface that allows easy interfacing to most microcontrollers. The interface is compatible with SPI®, QSPI™, and MICROWIRE™ protocols as well as DSPs. The part features a standby mode that is controlled via the serial interface. The ADT7301's wide supply voltage range, low supply current, and SPI-compatible interface make it ideal for a variety of applications including personal computers, office equipment, automotive, and domestic appliances. The ADT7301 is rated for operation over the -40°C to +150°C temperature range. It is not recommended to operate the device at temperatures above +125°C for greater than a total of 5% (5,000 hours) of the lifetime of the device. Exposure beyond this limit affects device reliability.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

## PRODUCT HIGHLIGHTS

1. On-chip temperature sensor that allows an accurate measurement of the ambient temperature. The measurable temperature range is -40°C to +150°C.
2. Supply voltage of 2.7 V to 5.25 V.
3. Space-saving 6-lead SOT-23 and 8-lead MSOP packages.
4. Typical temperature accuracy of ±0.5°C.
5. 13-bit temperature reading to 0.03125°C resolution.
6. Shutdown mode that reduces the power consumption to 4.88 µW with V<sub>DD</sub> = 3.3 V @ 1 SPS.
7. Compatible with AD7814.

Power Dissipation <sup>2</sup>	$W_{MAX} = (T_J \text{ max} - T_A^3)/\theta_{JA}$
Thermal Impedance	
$\theta_{JA}$ , Junction-to-Ambient (Still Air)	190.4°C/W
8-Lead MSOP (RM-8)	
Power Dissipation <sup>2</sup>	$W_{MAX} = (T_J \text{ max} - T_A^3)/\theta_{JA}$
Thermal Impedance <sup>4</sup>	
$\theta_{JA}$ , Junction-to-Ambient (Still Air)	205.9°C/W
$\theta_{JC}$ , Junction-to-Case	43.74°C/W
IR Reflow Soldering	
Peak Temperature	220°C (0°C/5°C)
Time at Peak Temperature	10 sec to 20 sec
Ramp-Up Rate	3°C/s max
Ramp-Down Rate	−6°C/s max
Time 25°C to Peak Temperature	6 minutes max
IR Reflow Soldering—Pb-Free Package	
Peak Temperature	260°C (0°C)
Time at Peak Temperature	20 sec to 40 sec
Ramp-Up Rate	3°C/s max
Ramp-Down Rate	−6°C/s max
Time 25°C to Peak Temperature	8 minutes max

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 3. Plot of Maximum Power Dissipation vs. Temperature

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

**TEMPERATURE VALUE REGISTER**

The temperature value register is a 14-bit read-only register that stores the temperature reading from the ADC in 13-bit two's complement format plus a sign bit. The MSB (DB13) is the sign bit. The ADC can theoretically measure a 255°C temperature span. The internal temperature sensor is guaranteed to a low value limit of -40°C and a high limit of +150°C. The temperature data format is shown in Table 5, which shows the temperature measurement range of the device (-40°C to +150°C). The typical performance curve is shown in Figure 11.

**Table 5. Temperature Data Format**

Temperature	Digital Output DB13 ... DB0
-40°C	11, 1011 0000 0000
-30°C	11, 1100 0100 0000
-25°C	11, 1100 1110 0000
-10°C	11, 1110 1100 0000
-0.03125°C	11, 1111 1111 1111
0°C	00, 0000 0000 0000

**Temperature Conversion Equations**

*Positive Temperature* =  $ADC\ Code(d)/32$

*Negative Temperature* =  $(ADC\ Code(d)^1 - 16384)/32$

*Negative Temperature* =  $(ADC\ Code(d)^2 - 8192)/32$

Figure 13. Temperature-to-Digital Transfer Function

<sup>1</sup> ADC code uses all 14 bits of the data byte, including the sign bit.  
<sup>2</sup> DB13 (the sign bit) is removed from the ADC code.

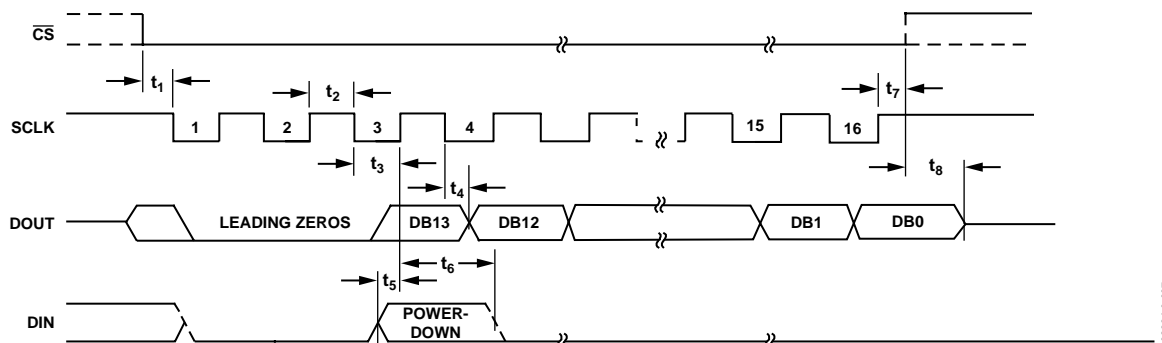

Figure 14. Serial Interface Timing Diagram

02864-007

## SERIAL INTERFACE

The serial interface on the ADT7301 consists of four wires:  $\overline{CS}$ , SCLK, DIN, and DOUT. The interface can be operated in 3-wire mode with DIN tied to ground, in which case the interface has read-only capability, with data being read from the data register via the DOUT line. It is advisable to always use  $\overline{CS}$  to create a communications window, as shown in Figure 14; this improves synchronization between the ADT7301 and the master device. The DIN line is used to write the part into standby mode, if required. The  $\overline{CS}$  line is used to select the device when more than one device is connected to the serial clock and data lines. The part operates in a slave mode and requires an externally applied serial clock to the SCLK input to access data from the data register. The serial interface on the ADT7301 allows the part to be interfaced to systems that provide a serial clock synchronized to the serial data, such as the 80C51, 87C51, 68HC11, 68HC05, and PIC16Cxx microcontrollers as well as DSP processors.

A read operation from the ADT7301 accesses data from the temperature value register, while a write operation to the part writes data to the control register.

## Read Operation

Figure 14 shows the timing diagram for a serial read from the ADT7301. The  $\overline{CS}$  line enables the SCLK input. Thirteen bits of data plus a sign bit are transferred during a read operation. Read operations occur during streams of 16 clock pulses. The first 2 bits out are leading zeros and the next 14 bits contain the temperature data. If  $\overline{CS}$  remains low and 16 more SCLK cycles are applied, the ADT7301 loops around and outputs the two leading zeros plus the 14 bits of data that are in the temperature value register. When  $\overline{CS}$  returns high, the DOUT line goes into three-state. Data is clocked out onto the DOUT line on the falling edge of SCLK.

## Write Operation

Figure 14 also shows the timing diagram for a serial write to the ADT7301. The write operation takes place at the same time as the read operation. Only the third bit in the data stream provides a user-controlled function. This third bit is the power-down bit, which, when set to 1, puts the ADT7301 into shutdown mode. In addition to the power-down bit, all bits in the input data stream should be 0 to ensure correct operation of the ADT7301. Data is loaded into the control register on the 16<sup>th</sup> rising SCLK edge; the data takes effect at this time. Therefore, if the part is programmed to go into shutdown, it does so at this point. If  $\overline{CS}$  is brought high before this 16<sup>th</sup> SCLK edge, the control register is not loaded and the power-down status of the part does not change. Data is clocked into the ADT7301 on the rising edge of SCLK.

## APPLICATIONS INFORMATION

### MICROPROCESSOR INTERFACING

The ADT7301 serial interface allows easy interface to most microcomputers and microprocessors. Figure 15 to Figure 18 show some typical interface circuits. The serial interface on the ADT7301 consists of four wires:  $\overline{CS}$ , DIN, DOUT, and SCLK. All interface circuits shown use all four interface lines. However, it is possible to operate the interface with three wires. If the application does not require the power-down facility offered by the ADT7301, the DIN line can be tied low permanently. Thus, the interface can be operated from just three wires: SCLK,  $\overline{CS}$ , and DOUT.

The serial data transfer to and from the ADT7301 requires a 16-bit read operation. Many 8-bit microcontrollers have 8-bit serial ports, and this 16-bit data transfer is handled as two 8-bit transfers. Other microcontrollers and DSP processors transfer 16 bits of data in a serial data operation.

#### ADT7301-to-MC68HC11 Interface

Figure 15 shows an interface circuit between the ADT7301 and the MC68HC11 microcontroller. The MC68HC11 is configured in master mode with its CPOL and CPHA bits set to a Logic 1. When the MC68HC11 is configured like this, its SCLK line idles high between data transfers. Data is transferred to and from the ADT7301 in two 8-bit serial data operations. Figure 15 shows the full (4-wire) interface. PC1 of the MC68HC11 is configured as an output and is used to drive the  $\overline{CS}$  input.

Figure 15. ADT7301-to-MC68HC11 Interface

#### ADT7301-to-8051 Interface

Figure 16 shows an interface circuit between the ADT7301 and the microcontroller. The 8051 is configured in its Mode 0 serial interface mode. The serial clock line of the 8051 (on P3.1) idles high between data transfers. Data is transferred to and from the ADT7301 in two 8-bit serial data operations. The ADT7301 outputs the MSB of its data stream as the first valid bit while the 8051 expects the LSB first. Thus, the data read into the serial buffer needs to be rearranged before the correct data-word from the ADT7301 is available in the accumulator.

In the example shown in Figure 16, the ADT7301 is connected to the serial port of the 8051. Because the serial interface of the 8051 contains only one data line, the DIN line of the ADT7301 is tied low in Figure 16.

For applications that require the ADT7301 power-down feature, the serial interface should be implemented using data port lines on the 8051. This allows a full-duplex serial interface to be implemented. The method involves generating a serial clock on one port line while using two other port lines to shift data in and out with the fourth port line connecting to  $\overline{CS}$ . Port lines 1.0 to 1.3 (with P1.1 configured as an input) can be used to connect to SCLK, DOUT, DIN, and  $\overline{CS}$ , respectively, to implement this scheme.

\*ADDITIONAL PINS OMITTED FOR CLARITY

Figure 16. ADT7301-to-8051 Interface

#### ADT7301-to-PIC16C6x/7x Interface

Figure 17 shows an interface circuit between the ADT7301 and the PIC16C6x/7x microcontroller. The PIC16C6x/7x synchronous serial port (SSP) is configured as an SPI master with the clock polarity bit set to a Logic 1. In this mode, the serial clock line of the PIC16C6x/7x idles high between data transfers. Data is transferred to and from the ADT7301 in two 8-bit serial data operations. In the example shown in Figure 17, port line RA1 is being used to generate the  $\overline{CS}$  for the ADT7301.

\*ADDITIONAL PINS OMITTED FOR CLARITY

Figure 17. ADT7301-to-PIC16C6x/7x Interface

### ADT7301-to-ADSP-21xx Interface

Figure 18 shows an interface between the ADT7301 and the ADSP-21xx DSP processor. To ensure correct operation of the interface, the SPORT control register should be set up as follows:

TFSW = RFSW = 1, alternate framing  
 INVRFS = INVTFS = 1, active low framing signal  
 DTYPE = 00, right justify data  
 SLEN = 1111, 16-bit data-words  
 ISCLK = 1, internal serial clock  
 TFSR = RFS = 1, frame every word  
 IRFS = 0, RFS configured as input  
 ITFS = 1, TFS configured as output

The interface requires an inverter between the SCLK line of the ADSP-21xx and the SCLK input of the ADT7301. On the ADSP-21xx interface, the TFS and RFS of the SPORT are tied together; TFS is set as an output, and RFS is set as an input. The DSP operates in alternate framing mode and the SPORT control register is set up as described in this section.

\*ADDITIONAL PINS OMITTED FOR CLARITY

Figure 18. ADT7301-to-ADSP-21xx Interface

### MOUNTING THE ADT7301

The ADT7301 can be used for surface or air temperature sensing applications. If the device is cemented to a surface with a thermally conductive adhesive, the die temperature will be within about 0.1°C of the surface temperature because of the ADT7301's low power consumption. Care should be taken to insulate the back and leads of the device if the ambient air temperature is different from the surface temperature being measured.

The ground pin provides the best thermal path to the die; therefore, the temperature of the die is close to that of the printed circuit ground track. Care should be taken to ensure that this is in good thermal contact with the measured surface.

As in any IC, the ADT7301 and its associated wiring and circuits must be kept free from moisture to prevent leakage and corrosion, particularly in cold conditions where condensation is more likely to occur. Water-resistant varnishes and conformal coatings can be used for protection. The small size of the ADT7301 allows it to be mounted inside sealed metal probes, which provide a safe environment for the device.

### SUPPLY DECOUPLING

The ADT7301 should be decoupled with a 0.1 µF ceramic capacitor between  $V_{DD}$  and GND. This is particularly important if the ADT7301 mount is remote from the power supply.
